

FL-01 — AI Workflow Audit

Waiz Ahmad • BSIT Student & AI Frontend Engineer Intern • FlyRank AI Internship

1. Toolkit Setup

Claude account: Active, ChatGPT account: Active, Anthropic Academy account: Active, Course: AI Fluency: Framework & Foundations — at least Module 1 completed (certificate/screenshot attached), Claude Project: Created and configured with custom instructions screenshot attached

2. Recurring Task Audit

Fourteen recurring tasks from this week's coursework, research, internship work, and skill-building, classified using the Just Me / Delegate with Review / Collaborate with AI / Fully Automate framework.

#	Recurring Task	Classification	One-line Rationale
1	Studying for / taking exams	Just Me	Exam integrity + retention depends on my own recall/practice, AI can't replace that.
2	Reading & summarizing research papers	Collaborate with AI	AI speeds summaries/notes, but I verify key claims and relevance from the source.
3	Identifying gaps in existing research (AI fault detection in virtual systems)	Collaborate with AI	AI suggests angles quickly, but I decide what qualifies as a valid research gap.
4	Applying my chosen research methodology	Delegate with Review	AI can draft analysis steps/checklists, but I validate methods/results before using them.
5	Writing recommendations/conclusions from findings	Just Me	This is my core academic contribution—must be my reasoning and wording for integrity.
6	Learning HTML/Bootstrap	Collaborate with AI	I use AI as a tutor for concepts/examples and to debug practice code.
7	Writing & debugging frontend code (internship)	Collaborate with AI	AI helps faster iteration, but I read/understand every line before committing/shipping.
8	Integrating AI models into front-end systems (API usage/UI integration)	Delegate with Review	AI can draft integration snippets, but I test with real inputs and handle edge cases.
9	Testing/evaluating AI model performance & outputs	Delegate with Review	AI can run/summarize test batches, but I verify metrics and sanity-check outputs.
10	Formatting citations/references for research paper	Fully Automate	Mechanical formatting is low-stakes; tools can generate styles quickly (spot-check final).
11	Completing internship capstone project	Collaborate with AI	AI helps planning, breaking tasks, and drafting parts; I implement + ensure originality/requirements.
12	Completing internship multiple assignments (tickets/tasks)	Delegate with Review	AI drafts solutions/templates, but I ensure correctness, rubric match, and submit my own work.
13	GitHub repo work (README, commit messages, PR descriptions, issue summaries)	Collaborate with AI	AI drafts clear text; I decide what to commit/merge and keep repo history accurate.
14	CMD/terminal workflow (env setup, package installs, run scripts, fixing errors)	Collaborate with AI	AI helps interpret errors and propose commands, but I run carefully and confirm changes.

3. Claude Project — Custom Instructions

Claude Project Name: FlyRank, configured with custom instructions — screenshot attached

Custom Instructions:

- Who I am:

I'm a BSIT student and Frontend/AI intern. I work on internship assignments/capstone, frontend UI development/debugging, and academic research AI fault detection in virtual systems.

- My goals (current):

Ship internship tasks faster without breaking quality. Improve frontend fundamentals (HTML/CSS/Bootstrap/JavaScript) and integration skills. Read research papers efficiently and produce accurate notes.

- **Tone & style:**

Simple wording, step-by-step, short actionable checklists. Ask 1–2 clarifying questions if needed. Avoid long lectures.

- **Working rules:**

Don't fabricate sources/citations—if unsure, say so. For code explain reasoning, edge cases, and tests keep outputs runnable. For academic writing: keep integrity help structure and clarity, but conclusions remain mine. When giving commands show safe commands and mention risks briefly what it changes.

4. Target Tasks for FL-02 through FL-04

Target Task 1 — Frontend code writing/debugging with AI (Task 7)

Done well means: I can explain every line I commit no black-box. UI works as required on key screen sizes, passes review on first pass or max 1 small fix, and saves ~30% time vs solo.

Target Task 2 — AI model integration + testing (Tasks 8–9)

Done well means: Zero regressions: existing features/tests keep passing. Performance/quality meets the target I set before starting e.g., latency, accuracy, UI behavior. Any failure is debugged with a clear root cause not endless re-prompting.

Target Task 3 — Research paper reading & summarization (Task 2)

Done well means: Summary is spot-checked against the PDF and matches key claims. Notes clearly connect to my research gap why it matters to my topic. Per-paper reading time drops by ~50% while keeping accuracy.
